CERTIFICATE

This is to certify that ~~Mr./Ms.~~ Bhavika Rane

Roll No. 8 PRN: 1262242228

Class: 3rd year Panel: F

has satisfactorily completed his/her term work in

User Interface & User Experience course.

Date: 22/10/2026

Practical In-charge

Head of Department

Bhanika Rane

UI-UX

ASSIGNMENT 1

Problem Statement and Critical Analysis of existing interfaces.

AIM : To critically analyze existing Indian fashion shopping application interfaces & identify opportunities to improve their learnability, usability, consistency, navigation, visual hierarchy, & overall user experience.

PROBLEM STATEMENT : The objective is to analyze the user interface of an existing fashion shopping app & identify areas of improvement. The selected domain is Indian fashion app, with AJIO & Savana as primary apps.

THEORY.

UI concerns the visual & interactive elements of an app. UX design focuses on overall experience of users while interacting with application.

1. Learnability : The interface should be easy for new users to understand.

2. Usability : Users should be able to search for products, apply filters, compare items, select sizes & purchase differently.

FOR EDUCATIONAL USE

3. Consistency : colours, fonts, icons, button, spacing, & interacting patterns should remain consistent across screens.

4. Use of Metaphors : Familiar symbols such as heart for a wishlist, shopping bag & a person icon for profile

5. Navigation & Discoverability : Imp. categories & shopping features should be easy to locate without excessive scrolling.

6. Visual Hierarchy : Imp. info. such as image, prices, ratings, & primary action buttons.

CRITICAL ANALYSIS :
In learnability, AJIO received 8.5/10 & Savana received 9/10. Usability were 9/10 AJIO & 8.8/10 Savana. Consistency AJIO 8.6/10 & Savana 9.3/10

CONCLUSION :
The analysis helped identify areas where Savana fashion shopping could be improved.

Sundaram
FOR EDUCATIONAL USE

ASSIGNMENT 02 : USER RESEARCH, PLANNING & PERSONA DEVELOPMENT.

AIM : To study user requirements & shopping behaviours, analyse existing fashion-shopping interface, develop user personas.

PROBLEM STATEMENT : Fashion shopping apps serve users with diff. goals & expectations. Some users priorities the latest trends & attractive product images, other focus on price, quality, navigation.

THEORY : User research is an imp. part of UX design process because it helps designers understand people who will use an app.

Research & Planning →

1) Study of Existing Apps.
AJIO noted for its filters & convenient controls, promotional content can make its homepage feel crowded. Savana was noted for its clean visual presentation.

2) Identification of user needs.
- Relevant products without excess scrolling
- Filter options
- Product quality
- Receive useful size guidance before purchasing

FOR EDUCATIONAL USE

- Compare products meaningful info.
- understand discounts, charges.

3) Persona

The analysis indicates that the app should support several connected activities: browsing collections, search for products, apply filters, examining product details.

The design should also help users maintain control over their decisions.

CONCLUSION

The research & planning stage established a user-centered foundation for Savana-The interface comparison identified opportunities for improvement, while personas gives different users require different forms of support. For Lo-Fi wireframes, planned screens address & ease of use.

ASSIGNMENT 03 - LOW-FIDELITY WIREFRAMES FOR THE SAVANA APPLICATION.

AIM: To design low fidelity wireframes for the Savana fashion shopping application by arranging major interface elements.

PROBLEM STATEMENT: After analyzing fashion applications & identifying user requirements, represent through wireframes. A wireframe provides a simplied view of an interface & helps designers plan the placement of content.

Purpose: Create Lo-Fi wireframes that address the problems identified.

THEORY.

Low-fidelity wireframes for Savana were prepared as hard-drawn screen layouts. 9 principal screens & establish the main flow.

The wireframes helped establish content hierarchy, screen structure, & relationship between main shopping tasks.

By separating the structure from visual

FOR EDUCATIONAL USE

styling, design could focus first on user's journey & placements of essential controls.

The wireframe also provides a reference for subsequent Hi-Fi design stage.

CONCLUSION:

The Lo-Fi wireframe translates the findings from problem analysis & user research into a structured shopping interface. The nine screens cover browsing, filtering, product evaluation, reviews, shopping-bag & order confirmation.

ASSIGNMENT 04 - HIGH FIDELITY UI DESIGN USING FIGMA

AIM:
To transform the low fidelity wireframes of Savana fashion shopping app into a high fidelity interface using Figma, apply a consistent visual design system & present the planned shopping features in a polished layout.

PROBLEM STATEMENT:
Low fidelity wireframes establish the basic structure of an app, but do not fully communicate the final appearance of the interface.

THEORY:
High fidelity UI design represents an interface in greater visual detail than a low fidelity wireframe. It includes intended visual style, detailed components, typography, spacing, colors, icons & imagery.

A successful Hi-Fi design should not focus only on appearance. It should also preserve usability, actions easy to identify, provid

8

1. Translating wireframes into detailed screens.
2. Establishing the visual identity
3. Designing product Discovery
4. Designing product info. & comparison.
5. Designing Size Recommendation.

CONCLUSION.

High fidelity design is the stage in which planned interface blooms a detailed visual representation. for savana, stage should connect the user requirements & lo-fi layouts.

ASSIGNMENT 05 - HEURISTIC EVALUATION OF VERA SHOPPING APP

AIM:
To evaluate the VERA shopping app prototype using heuristic evaluation principles, issues, & improvements.

PROBLEM STATEMENT:
The VERA app may present usability challenges related to product discovery, filters, size recommendation, navigation & product info.

THEORY:
Heuristic evaluation is a usability inspection method used to identify interface problems using established usability principles. Evaluation examines user control, simplicity, consistency, predictability & other factors affecting the user experience.

Key findings.
- User Control
- Simplicity
- Consistency
- Product info.
- Size Recommendation

FOR EDUCATIONAL USE

Additional Observations

Evaluation also recommend authentic creator or social reviews, subtle reward & offers, & desktop access along mobile experience.

Evaluation Result Conclusion

Total score : 51/75

The heuristic evaluation identified opportunities to improve VÉRA prototype usability, consistency, discovery & user feedback.

ASSIGNMENT -06

AIM:
To study usability testing of a Figma prototype using a remote testing tool (Maze

PROBLEM STATEMENT:
Study how the tool Maze can be used for un-moderated remote user testing of a website design created in Figma.

THEORY:
Maze is a remote user testing platform that lets designers test a clickable prototype with real users without writing any code. Since the website has been designed only in Figma, the Figma prototype link has been imported into Maze, so no tracking code has to be installed.

Maze is an easy-to-use tool & a test can be started in minutes. In Figma, open prototype, click share prototype, set audience to anyone with link & copy link.
In Maze, create a new account, create a maze, add a prototype test block,

FOR EDUCATIONAL USE

paste the link & copy the link & import it, add tasks & follow up questions.

- Direct import Figma.
- Missions of users
- Heatmaps for each screen
- success rate, misclick rate
- automatic reports.

Following by Maze:

- Test which design works best (A/B)
- understand confusing elements
- user behaviour
- Test new ideas
- study user clicks
- Find best user flow.

Conclusion:

Maze helps designers evaluate Figma prototypes through remote, unmoderated user testing. It records user interactions & provides reports that help identify confusing elements, compare design, & improve user flow before development

FAQs.

Sundaram
FOR EDUCATIONAL USE

1. Objective of user testing
Objective of user testing is to evaluate how easily users understand an interface, navigate its screens & complete assigned tasks. Helps identify usability problems & improve overall user experience.

2. Different methods of user testing.
Different methods include moderated testing, unmoderated remote testing, A/B testing & task based usability testing. These methods help designers understand user behaviour.

3. Features & benefits of Maze.
Maze provides Figma prototype imports, user missions, heatmaps, success rate, misclick rate, task duration metrics & exportable reports.

ASSIGNMENT 7.

Accessible & inclusive UI/UX design

AIM: To redesign existing Savana fashion shopping app for users with special needs & create an app which is accessible inclusive interactive prototype in Figma.

PROBLEM STATEMENT:

The existing app is designed for general problem. The app focuses on improving its accessibility for users with special need

THEORY:

Accessible & inclusive design ensures that people with different abilities & limitations can use the application effectively & comfortably.

Main include visual impairement, hearing, motor, cognitive.

Tools:

- Figma: Redesigning screens & creating interactive prototype.
- Web AIM contrast checker: Check color contra

Conclusion:

Accessible design helps make Savana app mor

FOR EDUCATIONAL USE

15

inclusive & easy to use. Improve readability, contrast, navigation, touch targets, feedback, better support users with different needs.

FAQs

1. Explain 4 principles of WCAG with examples.
   - Perceivable: Info. presented in ways user can perceive.
   - Operable: Interact controls must be usable
   - Understandable: Content & navigation clear
   - Robust: Content should work reliably with diff. browsers.

2. Discuss design users with visual, hearing, motor & cognitive impairements.
   - Visual require high contrast, readable text, & screen-reader support.
   - Hearing impairements require captions & visual alerts
   - Motor impairments require large touch target & simple interactions
   - Cognitive benifits from simple language, consistent layout, & reduced clutter.

These principles can help make Savana shopping experience more accessible & user friendly.
